

Systemic Inflammation in PsO-Associated Obesity

Patients With Psoriatic Disease Accumulate Visceral Fat Disproportionately¹

Comparison of Adipose Tissue

Patients with psoriatic disease had a

13.6% + 5.9%
greater VAT/SAT ratio greater VAT volume

compared with BMI-matched controls.

STUDY DESIGN

Methods: cross-sectional MRI pilot study

Patient Population: n=30 patients
(8 with PsO only; 22 with PsA) vs.
n=30 BMI-matched controls

Obesity Is Characterized by Excessive Expansion of VAT²

Not All Adipose Tissue Is Equal^{1,3,4}

SAT

- Located under the skin
- Largest adipose fat storage depot

VAT

- Located around organs
- Highly metabolically active
- Associated with **increased IL-6, TNF- α , IL-17**

PsO and Obesity Are Rooted in Chronic Systemic Inflammation^{2,5-8}

In patients with PsO and obesity, **residual systemic inflammation** may persist even when skin is nearly clear (PASI $\leq$ 2) due to higher BMI and VAT.⁵
